

The problem:

Unpredictable output

breaks integrations

Introduction: From Text to Structured Data

In Course 2, Module 1, your agents returned free-form text:

```
# From previous modules
agent = LlmAgent(
    model="gemini-2.5-flash",
    instruction="Extract product information from user messages"
)

# User: "I want the iPhone 15 Pro with 256GB"
# Agent response: "The user is interested in an iPhone 15 Pro with 256GB storage."
```

The problem:

Unpredictable output breaks integrations

Without structured output, even good instructions produce inconsistent results:

```
# No output schema - unpredictable format
text_agent = LlmAgent(
    model="gemini-2.5-flash",
    instruction="Extract product name, price, and storage from the user's message"
)

# What happens?
# User: "I want iPhone 15 Pro 256GB for $999"

# Response 1: "Product: iPhone 15 Pro, Price: $999, Storage: 256GB"
# Response 2: "The iPhone 15 Pro costs $999 and has 256GB storage"
# Response 3: "iPhone 15 Pro - $999 - 256GB"
```

The root problem

Your application can't reliably parse these varying formats.
You need guaranteed JSON structure.
